Dissolution Of Tablets

Tablet Dissolution is a standardised method for measuring the rate of drug release from a dosage form and the key word here is "standardisation" because for any results to be meaningful, it is essential that all the apparatus used for the testing, produces the same sets of results given all other parameters are equal.

About Dissolution Testing - What is Dissolution?

Dissolution test is done to verify the release of drug in the solution from the tablet because of binders, granulation, mixing and the coating may affect the release of drug from tablets. The amount of dissolved active ingredient is known as Q in the dissolution test. The limit of Q may be different in different monographs according to the nature of the formulation and its active ingredients.

In the pharmaceutical industry, drug dissolution testing is routinely used to provide critical in vitro drug release information for both quality control purposes, i.e., to assess batch-to-batch consistency of solid oral dosage forms such as tablets, and drug development, i.e., to predict in vivo drug release profiles. There are three typical situations where dissolution testing plays a vital role: formulation and optimization decisions: during product development, for products where dissolution

Ameliorated dissolution rate can be obtained in phenobarbital tablets with 10% gelatine, while 20% of gelatin diminishes the rate of dissolution due to the formation of the thick film. Plasdone, the water-soluble granulator, provides a faster rate of dissolution (Malviya et al., 2011). View chapter Purchase book
