The 6 lines you just drew are the sides of the regular hexagon. (See Figure 2). (See Figure 2). A hexagon is the only case in which a polygon's sides will exactly equal the radius but, by using a compass, a ruler and the calculator below, you can construct regular polygons with any number of sides.

The radius of the incircle is the apothem of the polygon. (Not all polygons have those properties, but triangles and regular polygons do). Breaking into Triangles. We can learn a lot about regular polygons by breaking them into triangles like this: Notice that: the "base" of the triangle is one side of the polygon.

Constructible regular polygons Now, by the end of Book IV, Euclid has described how to construct many regular polygons. The regular 3-gon, known as the equilateral triangle, was constructed in I.1, while the regular 4-gon, known as the square, was constructed in I.46. In book IV, regular 5-gons and regular 6-gons have been constructed.
