In this study, we have examined a mechanism to fabricate cellulose nanofiber actuators using conducting fabrics. The conducting fabrics were successfully attached to both the layers of 2,2,6,6-tetramethylpiperidinyl-1-oxyl radical (TEMPO)-oxidized cellulose nanofiber (TCNF) films using a simple heat-press method, and the obtained actuators functioned as bending-type actuators.

Even though the fibre or textile technology is nearly as old as human civilization itself, the process of meaningful unfolding and proper understanding of the fibre science as one of the major branches of polymer science is only of very recent origin and development. This book has been designed with the idea of combining the science and technology of natural and man-made fibres and integrating the vast subject area from the view point of material science and technology with special reference
