Tropical Forest Ecology A

Forest Ecology. Four decades ago, two young Smithsonian forest ecologists decided that tropical forests were too rich in species to study with traditional small forest plots. They tagged, identified and mapped some 240,000 trees on a 50-hectare plot of old growth forest on Barro Colorado Island in the Panama Canal. Subsequent censuses every five years have revealed how radically tropical forests change over time — in terms of species richness and distribution — and created an essential ...

In Tropical Forest Ecology, Egbert G. Leigh, Jr., one of the world's foremost tropical ecologists, introduces readers to the tropical forest and describes the intricate web of interdependence among the great diversity of tropical plants and animals. Focusing on the tropical forest of Barro Colorado Island, Panama, Leigh shows what Barro Colorado can tell us about other tropical forests--and what tropical forests can tell us about Barro Colorado.

Many tropical rainforest plants rely on animals as pollinators, and attract them with a combination of flashy color displays, alluring scents, and nutritious pollen rewards. Plants also rely on animals or the wind to help disperse their seeds to new areas. This dispersal expands the distribution of the population.

The average temperature in tropical rainforests ranges from 70 to 85°F (21 to 30°C). The environment is pretty wet in tropical rainforests, maintaining a high humidity of 77% to 88% year-round. The yearly rainfall ranges from 80 to 400 inches (200 to 1000 cm), and it can rain hard. It can downpour as much as 2 inches (5 cm) in an hour!

Tropical rainforest - Wikipedia

Tropical rainforests are distinguished not only by a remarkable richness of biota but also by the complexity of the interrelationships of all the plant and animal inhabitants that have been evolving together throughout many millions of years. As in all ecosystems, but particularly in the complex tropical rainforest community, the removal of one species threatens the survival of others with which it interacts.

Tropical ecology is the study of the relationships between the biotic and abiotic components of the tropics, or the area of the Earth that lies between the Tropic of Cancer and the Tropic of Capricorn. The tropical climate experiences hot, humid weather and rainfall year-round. While many might associate the region solely with the rainforests, the tropics are home to a wide variety of ecosystems that boast a great wealth of biodiversity, from exotic animal species to seldom-found flora.
